Form, Fit and Function Usability:
Spellman’s UMW Series of high voltage modules provides users with a form, fit and function replacement for presently available commercially made units, while providing superior features and benefits at competitive pricing. Utilizing proprietary power conversion technology, unique high voltage packaging, and Spellman’s unmatched encapsulation techniques, these SMT based high voltage modules provide improved performance and easier system integration at a lower cost when compared to the competition.

Advanced Power Conversion Topology:
UMW converters use a proprietary resonant power conversion topology providing exceptional efficiency and inherent low noise and ripple outputs. Radiated emissions are dramatically reduced compared to conventional switching topologies, effectively minimizing or even eliminating the need to shield the unit from adjacent circuitry.

The high voltage output is generated through the use of a ferrite core high voltage step up transformer which feeds the high voltage output circuitry. Units utilize an appropriate arrangement of low capacitance Cockcroft-Walton voltage multiplier stages to obtain the specified high voltage output. Due to the fixed, high frequency conversion rate of the converter, the output capacitance is small resulting in minimal stored energy and fast rise times. Through the use of generously rated surge limiting resistors and a fast acting current loop, all units are fully arc and short circuit protected.

Control and Regulation:
The actual output voltage generated is sampled via a high impedance divider to create a voltage feedback signal. A current feedback signal is created via a current sense resistor being placed in the low end return of the high voltage output circuitry. These two accurate ground referenced feedback signals are used to precisely regulate and control the units output. These accurate and calibrated signals are also used for external monitoring purposes.

Due to the UMW’s unique converter topology it can provide full current into low impedance loads or even a short circuit. Standard units limit at 103% of maximum rated output current.

Standard User Interface:
The Spellman UMW Series offers a standard customer interface that provides current programming capability and positive polarity, buffered, low output impedance voltage and current monitor signals (zero to +4.64Vdc equals zero to full scale rated). A voltage programming input is provided where 0 to +4.64Vdc equals 0 to 100% of rated voltage.

Current programmability allows the user to set where the unit will current limit, anywhere from 0 to 100% of maximum rated current. This feature is beneficial where less than full output current is desired, like in the case of protecting a sensitive load.

The buffered low impedance voltage and current monitor signals can drive external circuitry directly, while minimizing loading and pickup effects. These feature save the user the expense and implementation of external interface buffering circuitry while improving overall signal integrity.

Mechanical and Environmental Considerations:
The UMW Series are modular sheet metal enclosed converters measuring 8.00” X 4.50” X 1.075” (203mm X 114mm X 27mm). All units are encapsulated using a propriety silicon based potting material which is considerably lighter in weight than epoxy encapsulation techniques. Physical mounting of the unit is accomplished via the use of bottom mounted studs or threaded blind inserts, dependent upon model ordered.
SPECIFICATIONS

**Input Voltage:**
- 24Vdc

**Normal Voltage Range:**
- 23Vdc to 30Vdc

**Derated Voltage Range:**
- 11Vdc to 30Vdc

**Input Current:** (typical)
- Disabled: <40mA
- No load: <600mA
- Full load:
  - 60 watt units: 3 amps
  - 125 watt units: 6.2 amps

**Voltage Regulation:**
- Line: <0.01%
- Load: <0.01%

**Current Regulation:**
- Line: <0.01%
- Load: <0.01%

**Stability:**
- 0.01% per 8 hours, 0.02% per day after 30 min. warmup

**Accuracy:**
- 2% on all programming and monitoring, except I Sense 10%

**Temperature Coefficient:** (typical)
- 100ppm/°C

**Overshoot:**
- <0.1% Vp

**Environmental:**
- Temperature Range:
  - Operating: -40˚C to 65˚C case temperature
  - Storage: -55˚C to 85˚C, non-operational
- Humidity: 10% to 90%, non-condensing

**Dimensions:**
- 8.00” L X 4.50” W X 1.075” H
  - (203mm X 114mm X 27mm)

**Weight:**
- 1.75 lbs. (0.79kg)

**Regulatory Approvals:**
- Compliant to 2004/108/EC, the EMC Directive and 2006/95/EC, the Low Voltage Directive. Compliant to 2002/95/EC, RoHS, UL/CUL recognized, File E227588, Volume X1-A21

**ORDERING EXAMPLE**

UMW15P125/L

Model Voltage Polarity Power Option

If a high voltage mating connector is required it should be included at time of order. See page 3 for details.
I Sense Signal

The polarity of the current monitor signal is opposite of the polarity of the output voltage of the unit that generated it. So a positive output polarity unit creates a negative polarity current monitor signal; while a negative output polarity unit creates a positive polarity current monitoring signal. This signal is clamped to ground internally via a bidirectional 18 volt transient protection device and the signal is made available via a series connected 47kΩ isolation resistor. Internal HV dividers create a small, linear offset voltage on this current monitor signal that can be compensated for.

Programming and Monitor Signals

Voltage and current programming is done via positive polarity, high input impedance, 0 to 4.64Vdc signals. Voltage and current monitors are positive polarity, buffered low output impedance 0 to 4.64Vdc signals.

Signature Resistor

A unique identifying signature resistor for each type of unit is connected from Pin 10 to Ground. Details if desired are available upon request.

I Sense Signal

The polarity of the current monitor signal is opposite of the polarity of the output voltage of the unit that generated it. So a positive output polarity unit creates a negative polarity current monitor signal; while a negative output polarity unit creates a positive polarity current monitoring signal. This signal is clamped to ground internally via a bidirectional 18 volt transient protection device and the signal is made available via a series connected 47kΩ isolation resistor. Internal HV dividers create a small, linear offset voltage on this current monitor signal that can be compensated for.

Low Voltage Interface Connector

A mating AMP Mod-U interface connector will be provided.

High Voltage Output Mating Connector

An appropriate mating LGH high voltage connector (36” long) will be required. Please see table to left for specific part number.

High Voltage Return

Two gold plated 0.025” (0.63mm) square pins (15 and 16) are provided. These are connected to Power Ground Return.

IMPORTANT SAFETY PRECAUTIONS

SAFETY

THIS POWER SUPPLY GENERATES VOLTAGES THAT ARE DANGEROUS AND MAY BE FATAL. OBSERVE EXTREME CAUTION WHEN WORKING WITH THIS EQUIPMENT.

High voltage power supplies must always be grounded.

Do not touch connections unless the equipment is off and the capacitance of both the load and power supply is discharged.

Allow five minutes for discharge of internal capacitance of the power supply.

Do not ground yourself or work under wet or damp conditions.

SERVICING SAFETY

Maintenance may require removing the instrument cover with the power on.

Servicing should be done by qualified personnel aware of the electrical hazards.

WARNING note in the text call attention to hazards in operation of these units that could lead to possible injury or death.

CAUTION notes in the text indicate procedures to be followed to avoid possible damage to equipment.

Chapter 1

INTRODUCTION

1.1 Description of the UMW Series

Pellman’s UMW Series of high voltage modules offer a form, fit and function replacement for presently available commercially made units, while providing additional features and benefits. Utilizing proprietary power conversion technology these SMT based high voltage modules provide improved performance, reliability and easy system integration.

The UMW is available in two power ranges of 60 and 125 watts with output voltages spanning from 8kV to 20kV with fixed positive or negative polarities. Voltage & Current loops with automatic cross over control regulate the output into any load condition. The UMW is a reliable and robust series that is arc and short circuit protected. The comprehensive standard interface provides interfacing flexibility and all UMW’s are CE and RoHS compliant.

1.2 Standard Features

The UMW Series incorporates several standard features designed to optimize user satisfaction and safety:

- **Slow Start:** A 10 millisecond slow start time constant assures quick yet fully controllable risetime of the high voltage output.

- **Current Regulating Loop:** Current programmability allows the user to set where the unit will current limit, anywhere from 0 to 100% of maximum rated current.

- **0 to +4.64Vdc Programming Inputs:** Positive polarity, high impedance, ground referenced 0 to 4.64Vdc voltage programming inputs correspond to 0 to 100% rated voltage and current outputs.

- **0 to +4.64Vdc Monitor Outputs:** Positive polarity, low impedance, ground referenced 0 to 4.64Vdc voltage monitor outputs correspond to 0 to 100% rated output voltage and current.

- **Precision +5Vdc Reference Output:** A precision micro power band gap reference of +5Vdc, ±0.5%, 25ppm/°C with an output impedance of 475Ω is provided to simplify remote programming of the power supply.

- **Arc and Short Circuit Protected:** Due to the fixed, high frequency conversion rate the UMW’s output capacitance is small resulting in minimal stored energy. Through the use of generously rated surge limiting resistors and a fast acting current loop, all units are fully arc and short circuit protected.

1.3 Remote Operating Features

- **Enable Input:** The Enable Input allows the user to easily control the HV ON/HV OFF status of the power supply. HCMOS compatible signals A low (<1.5Vdc) enable input signal equals HV OFF, while a high (open or >3Vdc) enable signal equals HV ON.

  **Warning!**
  The Enable Input should not be used as for protection against user injury or for a safety interlock function.

UMW MANUAL 1 118102-001 REV A
1.4 **Options**
Several standard options are available to customize your UM for your application.

- **L** Option – Legacy Interface
- **X** Numbered Units – Custom Options

1.5 **Interpreting the Model Number**
The power supplies model number describes its capabilities. Model numbers are configured as follows:

UMW15P125/L where:

- **UMW** is the product series name
- **15** is the maximum output voltage in kV
- **P** is the output polarity
- **125** is the output power in watts
- **L** is the Legacy Interface

X numbered units are unique units custom developed for specific application requirements above and beyond the scope of the available standard options. Each 4 digit X number corresponds to an applicable specification control drawing.
Chapter 2

INSPECTION & INSTALLATION

Initial inspection and preliminary checkout procedures are recommended. For safe operation, please follow the procedures described in Chapter 3, Operating Instructions.

2.1 Initial Inspection

Inspect the packaging exterior for evidence of damage due to improper handling in transit. Notify the carrier and Spellman High Voltage immediately if damage is evident. Do not destroy or remove any of the packing material used in a damaged shipment.

After unpacking inspect the power supply for any visible signs of damage.

2.2 Mechanical Installation

Standard UMW modules are intended for chassis mounting using the four 8-32 studs that are provided on the bottom of the module. Reference the outline drawing for the appropriate hole pattern required for mounting.

2.3 Temperature Considerations

Keep in mind the UMW series is specified to operate at a maximum case temperature of 65°C. It is the responsibility of the user to assure that adequate provisions are made to maintain the case of the unit at an acceptable temperature. General recommendations for the 125 watt UMW units are that if an ambient temperature of no greater than 40°C is maintained and if a) 20 CFM of airflow is provided; or b) the unit is mounted to an 8” by 4.5” by 0.125” thick aluminum plate (or equivalent) an acceptable case temperature will be maintained.
Figure 1  Outline Dimensions
Chapter 3

Operating Instructions

3.1 Operation

**WARNING!**

This equipment generates dangerous voltages that may be fatal.

Proper grounding of all high voltage equipment is essential.

It is highly recommended that all testing comply with IEEE Standard 510-1983 IEEE Recommended Practices for Safety in High Voltage and High Power Testing. A copy of this standard can be downloaded from the Spellman High Voltage website here.

**DANGER**

**HIGH VOLTAGE**

**INPUT VOLTAGE**

Check the identification label on the power supply and confirm it matches the input voltage of the source supply that will be used to power the UMW module. All standard UMW units operate off +24Vdc.

**HIGH VOLTAGE CONNECTION**

Insure that high voltage connection is properly terminated to the load. Confirm that adequate air isolations spacings exist for the maximum voltage of the power supply, using the guideline of 10kV per inch (25.4mm) to any points that will be elevated to high voltage. All accessible high voltage points should be enclosed in a protective Faraday enclosure. Any access panels on the safety enclosure should be interlocked.

**GROUNDING**

Proper grounding of the unit is essential for reliable operation. Power Ground, Signal Ground and HV Ground Return are connected internally. For best performance they should not be connected externally.

The + Power Input and Power Ground Return connections (Pins 2/9 and Pins 1/8 respectively) carry the +24Vdc current that powers the unit, make these connections adequate enough to handle 3 amps for 60 watt units and 6.2 amps for 125 watt units, minimum. Additionally it is recommended that the chassis of the module to be tie to whatever potential is used as the local “system ground”.

Signal grounds relating to programming and monitor functions should be referenced to the UMW’s Signal Ground (Pin 5).

A physical load return connection must be made from the bottom of the load to the power supplies two pin High Voltage Return connector.

See Figure 2 for details.

**OPTIONS**

See Section 5 of this manual for setup and operating instructions if the unit under test has any options. Custom X numbers units may also require special test requirements; consult the unit’s specification control drawing for details.

**SIGNAL CONNECTIONS**

Connect the appropriate programming and monitoring signals to the unit as detailed in the figures in this chapter.

**INITIAL TURN ON**

A) Set the voltage and current programming inputs for zero output (Pin 6 and 11 respectively). Ground the Enable Input (Pin 4), to assure the unit is in HV OFF mode.

B) The DC input power can now be connected.

C) Enable the power supply by opening the Enable Input (Pin 4).

D) Set the current programming level (Pin 11) to just above the current anticipated that will be
drawn from the power supply or leave open for preset current to 103% of rated current.

E) Slowly increase the voltage programming (Pin 6) while monitoring the voltage and current monitors (Pin 13 and 12 respectively). Carefully note proper equipment operation and that the load is behaving as predicted.

F) To turn the HV OFF ground the Enable Input (Pin 4). If the equipment is to be left off for an extended period of time or service of the unit or load is required, turn off the DC input power.

Legacy Interface Units:
Negative output polarity units are programmed such that 5.0Vdc to 0.36Vdc equals 0 to 100% of rated output voltage

**WARNING!**

After turn off do not touch anything that has been connected to the output of the power supply. Wait a minimum of 5 minutes, and then discharge any remaining stored energy by connecting the high voltage output to ground. Failure to follow these safety warnings can result in injury or death.

remote programming

Programming and monitoring of the UMW is accomplished via the use of conventional positive polarity, ground referenced signals. All signal inputs and outputs are noise filtered, impedance protected and diode clamped providing an easy to use, robust analog customer interface. Excellent results have been obtained via the use of standard engineering design guidelines like twisted pair, shielded cables, the prudent dressing of interface wiring away from possible noise sources, short cable runs and adhering to a well thought out and executed grounding topology.

remote monitoring

The voltage and current monitor signals have adequate bandwidth capability to accurately represent the actual respective output within the dynamic limits of the power supply. See Figure 5 for details.

enable input

The enable input signal provides simple control of the ON/OFF functionality of the high voltage output. See Figure 6 for details.

**WARNING!**

It is extremely dangerous to use this circuit to inhibit high voltage generation for the purpose of servicing or approaching any area considered unsafe during normal usage.
Figure 2 – Grounding

Vpgm/lpgm: 0 to +4.64Vdc = 0 to 100% Rated Output

Note:
The +5V reference output (pin 7) is provided via an internal 475Ω inline series resistor for transient and short circuit protection. Take this impedance into account when selecting the resistance value of external programming potentiometers. Use 20KΩ pots if both voltage and current adjustments are used as shown above. Use a 10KΩ pot if only one pot is used and the other programming input is pulled up directly to +5V. The use of excessively low resistance values of programming potentiometers will create a significant voltage divider against the internal 475Ω series resistor resulting in the inability of programming the power supply to its maximum voltage and current outputs.

Chapter 4
Principles of Operation

Warning!
The energy levels used and generated by the power supply can be lethal! Do not attempt to operate the power supply unless the user has a sufficient knowledge of the dangers and hazards of working with high voltage. Do not attempt to approach or touch circuits that are connected to or have been connected to the power supply. Be certain to discharge any stored energy that may be present before and after the power supply is used. Consult IEEE recommended practices for safety in high voltage testing document number 510-1983.

4.1 DC Input
The UMW is a DC to DC converter. Within the power supply conversions from low voltage DC, to low voltage AC, to high voltage AC and finally to high voltage DC takes place. The DC input (+24Vdc) powers both the power conversion circuitry that creates the high voltage output, along with the low voltage DC housekeeping voltages that provide power to the affiliated support control circuitry.

4.2 Inverter
The DC input voltage is fed to the Inverter circuitry. Here the low voltage DC is converted to a low voltage, high frequency AC signal. This power conversion step allows for all subsequent power processing to take advantage of component miniaturization due to the high operational frequency. The Inverter functionality is controlled via the power supplies regulating loops which allows for complete command of the desired output voltage and current.

4.3 High Voltage Transformer
The high voltage transformer is a ferrite core step up type in which the primary is driven from the output of the Inverter circuit. The secondary of the high voltage transformer feeds the High Voltage Output Section.

4.4 High Voltage Output Section
The High Voltage Output Section varies by design, dependent upon the magnitude of the maximum output voltage of the particular UMW power supply.

Lower voltage units tend to be simple and robust rectification and filter circuits as ample increase of the voltage can be accomplished via the step up ratio of the high voltage transformer alone.

Higher rated output voltage units utilize an arrangement of half wave Cockcroft-Walton voltage multiplier stages to obtain the necessary output voltage.

Regardless of specifically how it’s generated, the actual output voltage is sampled via a high impedance divider to create a voltage feedback signal. A current feedback signal is created via a current sense resistor in the low end return of the High Voltage Output Circuitry. These two accurate ground referenced feedback signals are used to precisely regulate and control the unit, in addition to providing external monitoring.

4.5 Control Circuitry
Various SMT based control circuitry is used for all interfacing, monitoring and regulation functionality of the UMW modular power supply.

The voltage and current feedback signals generated in the High Voltage Output Section are compared to the requested voltage and current commands from the remote interface. The voltage or current loop error amplifier creates the appropriate error signal which is provided to the Pulse Width Modulation (PWM) circuitry.

The output of the PWM circuitry drives the Inverter circuit to provide the required output in a continuous closed loop control process, regulating in either voltage mode or current mode as required.
The internally generated voltage and current feedback signals are processed and provided to the remote interface for monitoring purposes.

The Enable Input from the remote interface controls the HV ON and HV OFF status of the power supply by interfacing with the PWM circuitry.

A precision +5Vdc, ±0.5%, 25ppm/°C micro power band gap reference output is provided for user programming convenience.

Figure 7 - Block Diagram
Chapter 5

OPTIONS

5.1 L Option - Legacy Interface

Functionality wise the Legacy Interface is electrically identical to other commercially made units so interface compliance is guaranteed.

5.2 X Numbered Units – Custom Options

When modification requirements of standard units are beyond the scope of standard options a custom unit is created. To accurately capture the details Spellman creates a unique Specification Control Drawing. This drawing outlines all items (mechanical, electrical, etc) that differ from a standard unit. These units will be designated as an X numbered unit. An X numbered unit will have an X number in its model number, like X1234. Together the UM data sheet and the applicable Specification Control Drawing will detail the parameters of these proprietary custom units.

The Legacy Interface provides form, fit and function replacement for presently available commercially made units.

MAINTENANCE

**WARNING!**
This power supply generates voltages that are dangerous and may be fatal.

Observe extreme caution when working with high voltage.

6.1 Periodic Servicing
The UMW product family does not require any periodic maintenance or servicing.

6.2 Performance Testing

**WARNING!**
High Voltage is dangerous. Only qualified personnel should perform these tests.

It is highly recommended that all testing comply with IEEE Standard 510-1983 IEEE Recommended Practices for Safety in High Voltage and High Power Testing. A copy of this standard can be downloaded from the Spellman High Voltage website here.

Test equipment includes, but is not limited to: an oscilloscope, a high impedance digital voltmeter, a current meter, a ripple checker, a high voltage load, a high voltage divider (such as the Spellman HVD-100 or HVD-200) an insulated load stick and insulated short circuit stick and a safety interlocked Faraday test cage to safety conduct the tests inside of. All equipment must be properly rated for the power supply to be tested. If you do not possess the required equipment and skills necessary to safety conduct these tests do not attempt to perform these performance tests.

6.3 High Voltage Dividers
High voltage dividers for precise measurements of output voltage with accuracy up to 0.1% are available from Spellman. The HVD-100 is used for voltages up to 100KV, the HVD-200 measures up to 200KV.

The HVD Series of high voltage dividers are designed for use with differential voltmeters or high impedance digital voltmeters. The high input impedance of the HVD Series is ideal for measuring high voltage low current sources, which would be overloaded by traditional lower impedance dividers.

Generalized high voltage test procedures are described in Bulletin STP-783, Standard Test Procedures for High Voltage Power Supplies. A copy of this bulletin can be downloaded from the Spellman High Voltage website here.

The HVD Series data sheet can be downloaded from the Spellman High Voltage website here. Contact the Spellman Sales Department for information on price and availability.
Chapter 7

FACTORY SERVICE

7.1 Warranty Repairs
During the Warranty period, Spellman will repair all units free of charge. The Warranty is void if the unit is worked on by other than Spellman personnel. See the Warranty in the rear of this manual for more information. Follow the return procedures described in Section 7.2. The customer shall pay for shipping to and from Spellman.

7.2 Factory Service Procedures
Spellman has a well-equipped factory repair department. If a unit is returned to the factory for calibration or repair, a detailed description of the specific problem should be attached.

For all units returned for repair, please obtain an authorization to ship from the Customer Service Department, either by phone or mail prior to shipping. When you call, please state the model and serial numbers, which are on the plate on the rear of the power supply, and the purchase order number for the repair. A Return Material Authorization Code Number (RMA Number) is needed for all returns. This RMA Number should be marked clearly on the outside of the shipping container. Packages received without an RMA Number will be returned to the customer. The Customer shall pay for shipping to and from Spellman.

A preliminary estimate for repairs will be given by phone by Customer Service. A purchase order for this amount is requested upon issuance of the RMA Number. A more detailed estimate will be made when the power supply is received at the Spellman Repair Center. In the event that repair work is extensive, Spellman will call to seek additional authorization from your company before completing the repairs.

7.3 Shipping Instructions
All power supplies returned to Spellman must be sent shipping prepaid. Pack the units carefully and securely in a suitable container, preferably in the original container, if available. The power supply should be surrounded by at least four inches of shock absorbing material. Please return all associated materials, i.e. high voltage output cables, interconnection cables, etc., so that we can examine and test the entire system.

All correspondence and phone calls should be directed to:

Spellman High Voltage Electronics Corp.
475 Wireless Boulevard
Hauppauge, New York 11788

### WICHTIGE SICHERHEITSHINWEISE

#### SICHERHEIT

**DIESES HOCHSPANNUNGSNETZTEIL ERZEUGT LEBENSGEFÄHRLICHE HOCHSPANNUNG. SEIN SIE SEHR VORSICHTIG BEI DER ARBEIT MIT DIESEM GERÄT.**

Das Hochspannungsnetzteil muß immer geerdet sein.

Berühren Sie die Stecker des Netzteiles nur, wenn das Gerät ausgeschaltet ist und die elektrischen Kapazitäten des Netzteiles und der angeschlossenen Last entladen sind.

Die internen Kapazitäten des Hochspannungsnetzteiles benötigen ca. 5 Minuten, um sich zu entladen.

Erden Sie sich nicht, und arbeiten Sie nicht in feuchter oder nasser Umgebung.

---

#### SERVICESICHERHEIT

Notwendige Reparaturen können es erforderlich machen, den Gehäusedeckel während des Betriebes zu entfernen.

Reparaturen dürfen nur von qualifiziertem, eingewiesenem Personal ausgeführt werden.

“**WARNING**” im folgenden Text weist auf gefährliche Operationen hin, die zu Verletzungen oder zum Tod führen können.

“**CAUTION**” im folgenden Text weist auf Prozeduren hin, die genauestens befolgt werden müssen, um eventuelle Beschädigungen des Gerätes zu vermeiden.
# CONSIGNES DE SÉCURITÉ

# CONSIGNES DE SÉCURITÉ EN CAS DE REPARATION

| La maintenance peut nécessiter l’enlèvement du couvercle lorsque l’alimentation est encore allumée. |
| Les réparations doivent être effectuées par une personne qualifiée et connaissant les risques électriques. |
| Dans le manuel, les notes marquées « **WARNING** » attirent l’attention sur les risques lors de la manipulation de ces équipements, qui peuvent entraîner de possibles blessures voire la mort. |
| Dans le manuel, les notes marquées « **CAUTION** » indiquent les procédures qui doivent être suivies afin d’éviter d’éventuels dommages sur l’équipement. |
# IMPORTANTI PRECAUZIONI DI SICUREZZA

## SICUREZZA

Questo alimentatore genera tensioni che sono pericolose e potrebbero essere mortali. Poni estrema cautela quando operi con questo apparecchio.

- Gli alimentatori ad alta tensione devono sempre essere collegati ad un impianto di terra.
- Non toccare le connessioni a meno che l’apparecchio sia stato spento e la capacità interna del carico e dell’alimentatore stesso siano scariche.
- Attendere cinque minuti per permettere la scarica della capacità interna dell’alimentatore ad alta tensione.
- Non mettere a terra il proprio corpo oppure operare in ambienti bagnati o sature d’umidità.

## SICUREZZA NELLA MANUTENZIONE

Manutenzione potrebbe essere richiesta, rimuovendo la copertura con apparecchio acceso.

La manutenzione deve essere svolta da personale qualificato, coscioso dei rischi elettrici.

Attenzione alle **AVVERTENZE** contenute nel manuale, che richiamano all’attenzione ai rischi quando si opera con tali unità e che potrebbero causare possibili ferite o morte.

Le note di **CAUTELA** contenute nel manuale, indicano le procedure da seguire per evitare possibili danni all’apparecchio.
SPELLMAN HIGH VOLTAGE ELECTRONICS

WARRANTY

Spellman High Voltage Electronics ("Spellman") warrants that all power supplies it manufactures will be free from defects in materials and factory workmanship, and agrees to repair or replace, without charge, any power supply that under normal use, operating conditions and maintenance reveals during the warranty period a defect in materials or factory workmanship. The warranty period is twelve (12) months from the date of shipment of the power supply. With respect to standard SL power supplies (not customized) the warranty period is thirty-six (36) months from the date of shipment of the power supply.

This warranty does not apply to any power supply that has been:
- Disassembled, altered, tampered, repaired or worked on by persons unauthorized by Spellman;
- Subjected to misuse, negligent handling, or accident not caused by the power supply;
- Installed, connected, adjusted, or used other than in accordance with the original intended application and/or instructions furnished by Spellman.

THE FOREGOING WARRANTY IS IN LIEU OF ALL OTHER WARRANTIES, EXPRESS OR IMPLIED, INCLUDING THOSE OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE.

The buyer's sole remedy for a claimed breach of this warranty, and Spellman's sole liability is limited, at Spellman's discretion, to a refund of the purchase price or the repair or replacement of the power supply at Spellman's cost. The buyer will be responsible for shipping charges to and from Spellman's plant. The buyer will not be entitled to make claim for, or recover, any anticipatory profits, or incidental, special or consequential damages resulting from, or in any way relating to, an alleged breach of this warranty.

No modification, amendment, supplement, addition, or other variation of this warranty will be binding unless it is set forth in a written instrument signed by an authorized officer of Spellman.

Factory Service Procedures

For an authorization to ship contact Spellman's Customer Service Department. Please state the model and serial numbers, which are on the plate on the rear panel of the power supply and the reason for return. A Return Material Authorization Code Number (RMA number) is needed from Spellman for all returns. The RMA number should be marked clearly on the outside of the shipping container. Packages received without an RMA Number may delay return of the product. The buyer shall pay shipping costs to and from Spellman. Customer Service will provide the Standard Cost for out-of-warranty repairs. A purchase order for this amount is requested upon issuance of the RMA Number (in-warranty returns must also be accompanied by a "zero-value" purchase order). A more detailed estimate may be made when the power supply is received at Spellman. In the event that the cost of the actual repair exceeds the estimate, Spellman will contact the customer to authorize the repair.

Factory Service Warranty

Spellman will warrant for three (3) months or balance of product warranty, whichever is longer, the repaired assembly/part/unit. If the same problem shall occur within this warranty period Spellman shall undertake all the work to rectify the problem with no charge and/or cost to the buyer. Should the cause of the problem be proven to have a source different from the one that has caused the previous problem and/or negligence of the buyer, Spellman will be entitled to be paid for the repair.
